

name *X. salicinum* is thus a superfluous illegitimate name, synonymous with *X. scottianum*. The plant currently called *X. salicinum*, based on *X. pyriforme* β (var.) *salicinum* Meisn. therefore requires a new name at species rank.

***Xylomelum benthamii* Orchard, nom. nov.**

A new combination *Trema tomentosa* var. *aspera* (Brongn.) Hewson (Ulmaceae)

E. Soepadmo (1977) treated *Trema viridis* as a synonym of *Trema cannabina*, while recognising the other two Australian taxa, *T. orientalis* and *T. tomentosa* as distinct species. In *Flora of Australia* (1989) I adopted the view that the name *T. cannabina* was misapplied to Australian collections, and that they should be recognised as constituting a distinct taxon.

I believed that this taxon was closely related to *T. tomentosa*, and proposed that it be treated as a subspecies of that species. A new combination was required, and I published *Trema tomentosa* var. *viridis* (Planch.) Hewson (1989).

Unfortunately, at the time I had overlooked Article 57.3 of the 1983 ICBN (now Art. 11.6) which rules that the autonym has priority over the name of the same date and rank that created it. Accordingly, my combination is invalid. The correct combination is *Trema tomentosa* var. *aspera*, which is formally created below.

The synonymy relates to Australian occurrences of the taxon only.
